Q: How to explicitly create unbound methods? A newbie question: I don't understand why this does not work, I've read the docs about this and many other articles but this is just one of those things that maybe you just have to learn by googling and maybe the experts on stack overflow have gotten around it but I just cannot find a solution. I have some objects I want to call method on with the setter not bound to a method, for example: `a = A()`
`a.foo = lambda: 5` I would like to do this, however it does not work because `setattr` creates a bound method. In python there is a distinction between bound and unbound functions, I know you can call unbound functions using `->` but I can't find any example of how to explicitly create an unbound function. I tried this: `def foo(): return 3`
`a = A()`
`a.foo.__func__ = foo` but I'm getting the error `AttributeError: foo.__func__: Unbound method __func__` Any ideas? A: One way to do this, which you have basically already done is the following: `a.foo = lambda: 3` You don't need to use `setattr`. A: In other languages, using `getattr` / `setattr` makes them behave like `__init__` and `__getattr__` and `__setattr__`, i.e., make them operate on attributes of the object. In Python, the `__getattribute__` or `__setattr__` can't be used directly to set an attribute. The argument `__dict__` is not a regular dictionary. It's a dict, but it is decorated with special `__get__` and `__set__` methods (which are
